

The **remreset** package

David Carlisle

1997/09/28

L^AT_EX includes a command `\@addtoreset` that is used to declare that a counter should be reset every time a second counter is incremented.

For example the book class has a line

```
\@addtoreset{footnote}{chapter}
```

So that the footnote counter is reset each chapter.

If you wish to bas a new class on book, but without this counter being reset, then standard L^AT_EX gives no simple mechanism to do this.

This package defines `\@removefromreset` which just undoes the effect of `\@addtoreset`. So for example a class file may be defined by

```
\LoadClass{book}  
\@removefromreset{footnote}{chapter}
```
